Active Studies
Validation of an evidence-based, nurse-designed fall risk assessment tool: Study 2
PI: Lindy Bilimek MSN, RN, AGCNS-BC
The ADAPT Fall Risk Assessment Tool was designed with the goal of decreasing instances of avoidable falls by providing nursing with the tools necessary to determine each patient's risk of falling and to readily act upon these risk factors. The inter-rater reliability (IRR) of the ADAPT Fall Risk Assessment Tool will be evaluated in a real-world nursing setting.
Nursing and Support Staff Perceptions of Inpatient MyChart Utilization
PI: Danielle Payne BSBio, MSN, RN, FNP-BC
The primary objective of this study is to assess MyChart use barriers identified by the nursing and patient care tech (PCT) workforce at Parkview using a workforce survey. The secondary aim is to identify facilitators that may increase patient MyChart utilization initiated by the nursing workforce. These objectives may inform strategies for increasing Patient MyChart use and future patient outcomes research as it relates to MyChart utilization.
